# TYPE-SAFE SHOPPING CALCULATOR

```java

public class ShoppingCalculator {
    public static void main(String[] args) {
        int quantity = 3;
        double unitPrice = 49.99;
        String storeName = "Goods Store";

        double totalCost = quantity * unitPrice;

        System.out.println("=== SHOPPING SUMMARY ===");
        System.out.println("Store Name: " + storeName);
        System.out.println("Quantity: " + quantity);
        System.out.printf("Unit Price: PHP %.2f%n", unitPrice);
        System.out.printf("Total Cost: PHP %.2f%n", totalCost);

        //totalCost should not be declared as int because it may contain decimal values.

    }
}
```

```
=== SHOPPING SUMMARY ===
Store Name: Goods Store
Quantity: 3
Unit Price: PHP 49.99
Total Cost: PHP 149.97

[Program finished]
